1x open wound in mid section of crown showing decay attached to a limb that has twisted and is resting on a lower limb

PHOTO 3

(image showing the crossing of major limbs in crown that can lead to open wounds in both limbs and eventually allow decay to begin)

PHOTO 4

image below shows another crossed/ rubbing limb over main road.

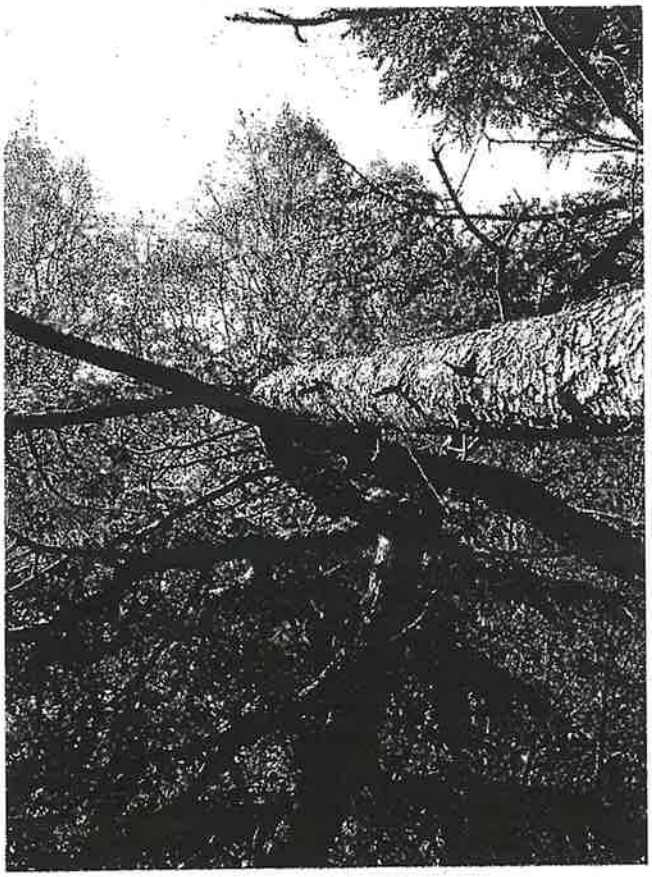

Photo 5

imagine below highlights a failed/split union that has allowed decay to enter. (Union now has small puddle of water. As winter is aproaching this can freeze and expand causing further damage and increase the risk of limb failure)

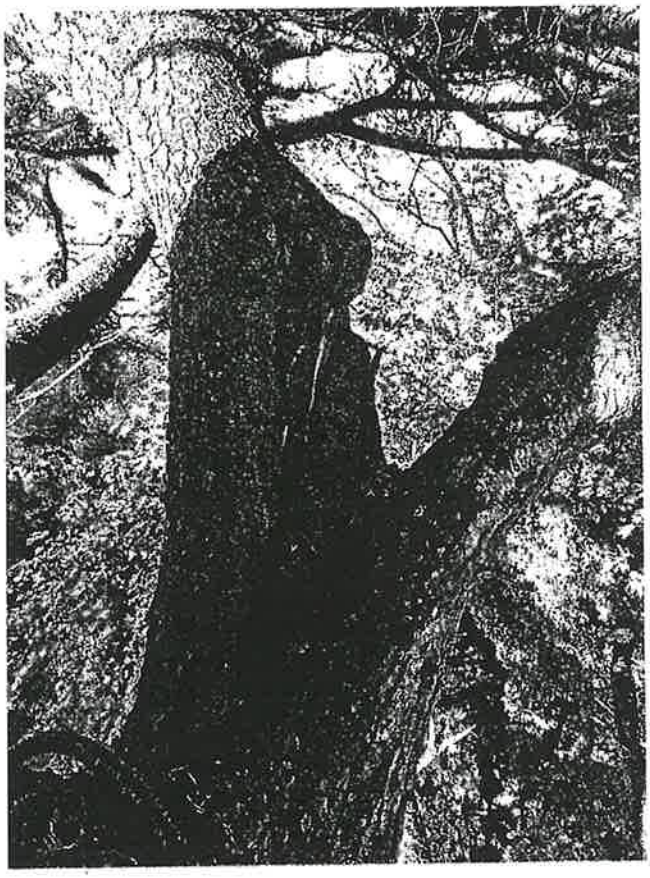

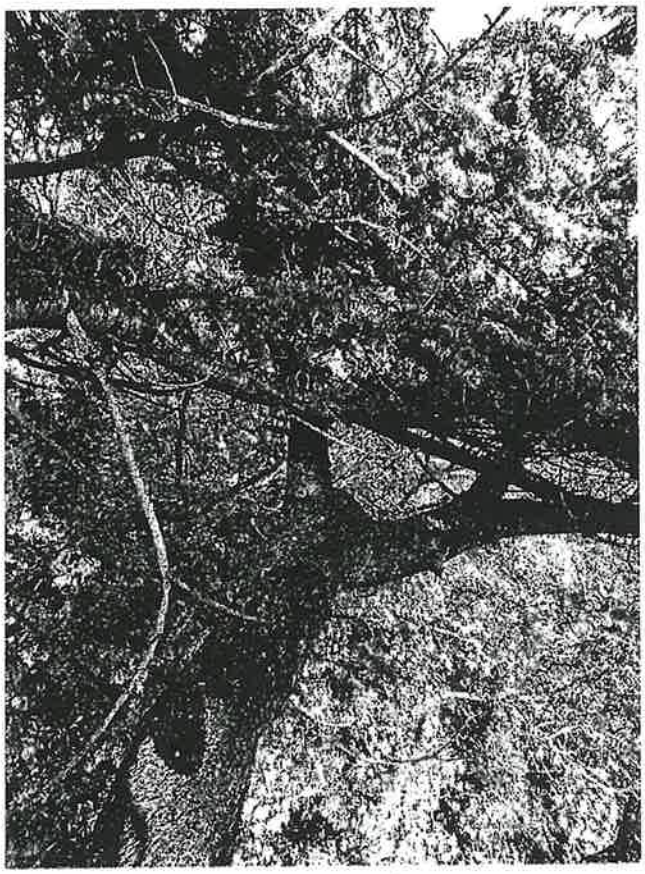

image below shows dense/heavy limbs lowering onto other limbs in crown

Photo 6

in the main union of the stem there are two old pruning cuts that have undergone substantial decay causing a foot of material to rot away leaving large cavities in which water and dirt now sit, allowing further hazards for the tree as winter aproaches.

PHOTO 7

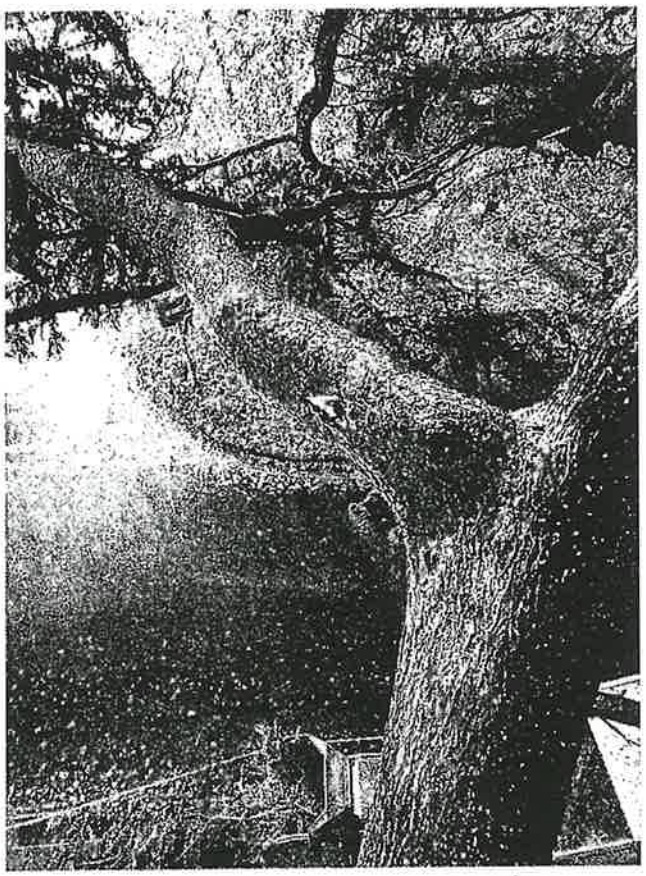

the two images below show removal of bark and damage to sapwood on limbs hit by falling branches. This can allow ingress for disease which will cause rot and failure

the three images below highlight

noticeable stress cracks in the main stem of the tree. These run along the east side of the tree indicating that the tree is under great stress due to its heavy southward lean

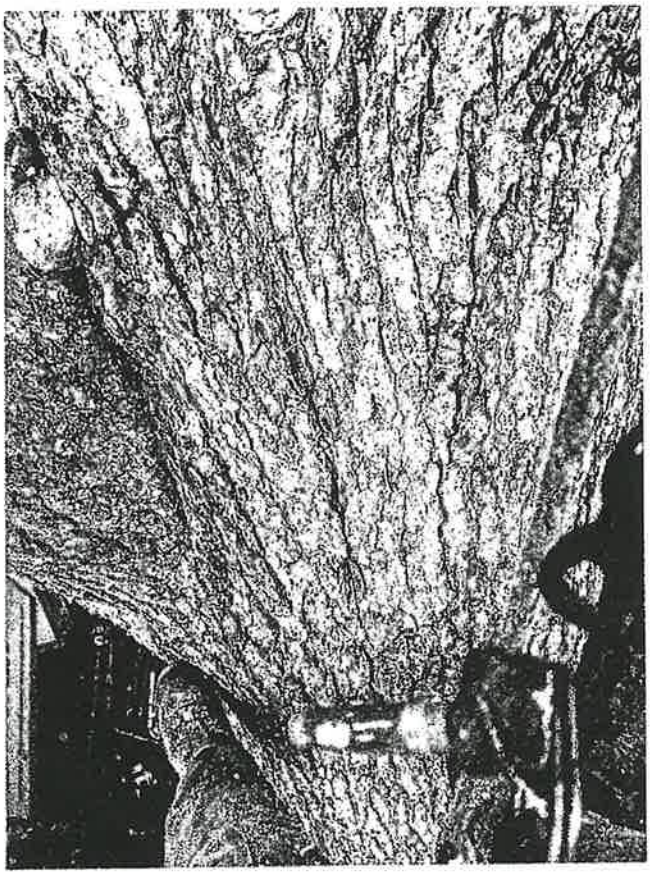

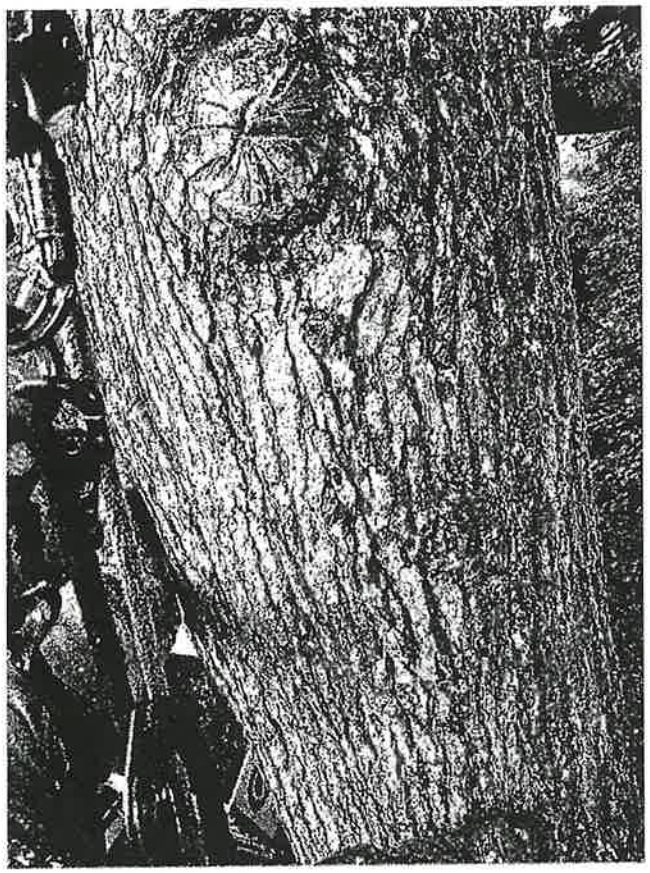

PHOTO 10

PHOTO 11

indicative of its heavy lean toward the south

the three images below show the newest filled limbs before removal. Likely cause of failue is exsessive weight, coupled with the trees southward lean
