

I was able to locate the EIA statement and went through the noise content. I understand nearest receptors have been identified, however, no information relating to the Background (LA90) noise levels for these receptors have been indicated. The screenshot below gives no information about LA90, hence, the readings as presented is not clear to me. We need this information before we can make any recommendations.

Table 6.9. Proposed Plant Noise Limits to Achieve Negligible Impact

Receptor Location	Daytime 0700-2300hrs	Night-time 2300-0700hrs
	dB LAr,Tr	dB LAr,Tr
Hay Lane Travellers' Site	58	52
Spittleborough Farm Residences	58	52
Farm House to South-west	58	52

6.5.5 Due to the relatively high background noise levels due to the proximity of the M4 coupled with the significant separation between the Proposed Development and the nearest noise sensitive receptors it is envisaged that these plant noise limits will be readily achieved in practice with standard mitigation measures such as silencers, enclosures and barriers]

Another observation from the list of proposed mitigations is the absence of condition limiting hours of operation during construction. I am not sure if this makes any difference at this stage, but it's worth raising.

I look forward to hearing from you.

Kind regards

Shella Ayongwe Asanga
