This report has been prepared by Stantec UK Ltd (Stantec) in its professional capacity as environmental specialists, with reasonable skill, care and diligence within the agreed scope and terms of contract and taking account of the manpower and resources devoted to it by agreement with its client and is provided by Stantec solely for the internal use of its client.

The advice and opinions in this report should be read and relied on only in the context of the report as a whole, taking account of the terms of reference agreed with the client. The findings are based on the information made available to Stantec at the date of the report (and will have been assumed to be correct) and on current UK standards, codes, technology and practices as at that time. They do not purport to include any manner of legal advice or opinion. New information or changes in conditions and regulatory requirements may occur in future, which will change the conclusions presented here.

This report is confidential to the client. The client may submit the report to regulatory bodies, where appropriate. Should the client wish to release this report to any other third party for that party's reliance, Stantec may, by prior written agreement, agree to such release, provided that it is acknowledged that Stantec accepts no responsibility of any nature to any third party to whom this report or any part thereof is made known. Stantec accepts no responsibility for any loss or damage incurred as a result, and the third party does not acquire any rights whatsoever, contractual or otherwise, against Stantec except as expressly agreed with Stantec in writing.

1 Introduction

1.1 Instruction

Stantec UK Ltd (Stantec) was commissioned by Woodlands (Mere) Ltd (the Client) to undertake a Phase 1 Land Quality Assessment (desk study) to support the proposed redevelopment of the Beaumont Business Centre, Woodlands Rd, Mere, Wiltshire, BA12 6BT (the Site) for a residential end use. It is understood that Savills plc is supporting the Client with the planning application and instructed Stantec to proceed on behalf of the Client in accordance with the proposal 330201363P1, by e-mail dated 21st May 2020.

1.2 Previous reports

On behalf of CG Fry and Sons Ltd (CG Fry), ESI Ltd (now Stantec) previously prepared the following reports to support the proposed acquisition and future redevelopment of the Site for residential use:

- Beaumont Business Centre: Phase I Geo-Environmental Report, Ref. 62756R1, ESI Ltd, July 2014; and,
- Beaumont Business Centre: Site Investigation and Geo-environmental Assessment Report, Ref. 62756R2, ESI Ltd, September 2014.

It is understood that the Client now proposes to redevelop the Site for residential purposes (70no. dwellings) and is currently seeking reliance on the reports listed above to support its proposed planning application. This report supersedes R1 above and, a brief summary of R2 is provided below in Section 2.2.

1.3 Objectives

The objective of this report is to support the proposed planning application for the redevelopment of the Site for a residential end use.

1.4 Report scope

This report provides the following key elements:

- A review of available historical Ordnance Survey maps and historical imagery;
- A record of a Site walkover;
- Summary of the key details obtained from an environmental data report;
- Discussion of current likely ground and groundwater conditions;
- The development of a preliminary Conceptual Site Model (CSM) and a qualitative assessment of environmental risk in the context of the proposed redevelopment; and,
- Recommendations for further work (where necessary).

1.5 Limitations

It is noted that some of the findings presented in this report are based on information supplied by third parties. Whilst we assume that all information is representative of past and present conditions and is presented in good faith, we can offer no guarantee as to its validity.

This report excludes consideration of potential hazards arising from any activities at the Site other than normal use, construction and occupancy for the potential residential land uses. Hazards associated with any other activities have not been assessed and must be subject to a specific risk assessment by the parties responsible for those activities.

The information contained in this report is intended for the use of the Client and no responsibility can be taken by Stantec for the use of this information by any third party or for uses other than that described in this report or detailed within the terms of our engagement.

2 Site information

2.1 Summary

The Site location is shown as Figure 1, and details of the Site are summarised in Table 2-1 below. Photographs of the Site taken during the walkover completed on 2nd June 2020 are presented in Appendix A.

Table 2-1 Site details

Site Address	Beaumont Business Centre, Woodlands Road, Mere, Wilts., BA12 6BT
NGR	381680, 131490
Area	Approximately 2ha
Site location and context	The Site is located off Woodlands Road, approximately 1km to the south of Mere, Wiltshire, and around 1.4km south of the A303 (Mere Bypass). The Site is bounded to the north and north-east by land undergoing redevelopment for a residential end use, to the southeast by derelict/ overgrown ground and to the south and west by agricultural land.
Current Site use	At the time of the walkover, the Site comprised a variety of buildings/ structures predominantly located in the centre and western areas of the Site with adjacent car parking to the west and a loading bay to the north. The main warehouses and associated office buildings located behind the warehouses to the west of the Site are currently used for storage by Furniturebox UK. The eastern parts of the Site were mostly soft landscaped and not in use. The south of the Site was occupied by several caravans where current employees live and look after the Site. A wide variety of waste was accumulated along the southeast boundary of the Site. Structures along the northern boundary of the Site included metal skips and a storage cabin that has remained in use for welding/ metals works (however this was not in use at the time of the visit due to the Covid-19 pandemic).
Site access	The Site has two main vehicular access points (one to the north and one to the south) and one pedestrian access point in the centre, all of which are located along the western boundary with Woodlands Road. The gates at each of the vehicular accesses are closed every night by the employees who live on Site.
Topography	The Site is located at an elevation of approximately 95-96m AOD, slightly falling to the east but generally level. The local topography tends to fall to the south-east. A small grassed bank is present along the western Site boundary, separating Woodlands Rd and the Site car park.
Ground coverage	The eastern part of the Site is predominantly covered with overgrown vegetation comprising semi-mature trees, overgrown brush and grass. The western Site areas are dominated by concrete hardstanding and building cover.

Surrounding land use	North	New dwellings have been built immediately to the north of the Site boundary. Construction of housing is currently ongoing beyond the northeast corner, undertaken by CG Fry.
	South	The land to the south of the Site is used for agriculture, with detached residential properties and further farmland beyond.
	East	Agricultural land is present to the east of the Site, with residential properties approximately 300m east of the Site boundary. A small fenced pond was found adjacent to the southeast corner of the Site, however it could not be approached due to the fence and overgrown vegetation covering the surroundings.
	West	Woodlands Road, running in a north-south direction, is located immediately to the west of the Site, with agricultural land beyond. A sewage works is present approximately 330m to the west of the Site.
Anecdotal Site information	The Site was used for the manufacture of steel chimneys in the past and previously contained large mechanically operated cranes that were carried along rail-tracks to move heavy items across the Site. The cranes are no longer present, but the tracks remain in-situ. It is understood that caravans have been stored on the Site for the past 5 to 7 years. It is also understood that foundations were constructed on the southern part of the Site for the construction of a small detached building however the structure was never erected.	
Evidence of contamination	Numerous potential sources of contamination were observed during the Site walkover as summarised below: • A redundant bunded overground tank, however it is understood to have been empty for years; • Redundant chimney; • Active electrical substation; • Wide variety of domestic and electronic waste accumulated across the Site, including barrels with undetermined contents, scrap vehicles, gas canisters, chemical/ gas containers, paints, batteries, etc.; • Storage cabins and skips with unknown contents; • Evidence of burning waste on Site; and, • Asbestos containing materials within the buildings.	

2.2 Previous reports

Phase 1 and Phase 2 Geo-Environmental reports were issued by ESI Ltd (now Stantec) in 2014. Intrusive investigations were undertaken in September 2014 and comprised trial pitting, infiltration testing, windowless sampler boreholes, super heavy dynamic probes, and associated soil, soil derived leachate, groundwater and geotechnical laboratory analysis.

The assessment concluded that Made Ground soils were present across the Site; however, no evidence of gross contamination was recorded and there was considered to be no requirement for active remediation. The implications for redevelopment of the Site included the potential requirement to remove the Made Ground for off-site disposal or to place a minimum 600mm of suitable subsoil and topsoil in private gardens and/ or soft landscaping.

Report Reference: 330102363R1

Report Status: Final

In addition the potential risks to the wider environment (i.e. local groundwater and surface water receptors) from leaching of the Made Ground were assessed to be low to moderate. This was based on the monitoring data which suggested that groundwater beneath the Site appeared to be perched and discontinuous. Laboratory data suggested limited impacts from PAHs and hydrocarbon compounds. However, given the absence of significant River Terrace Deposits, the presence of cohesive alluvial deposits and the underlying Kimmeridge Clay Formation, no specific remediation or risk management was considered to be warranted.

The investigation concluded that the Site fell in to ground gas Characteristic Situation 3 due to elevated flows. However, this was based on a limited data set.

3 Desk study information

The following section presents the findings of a desk study assessment which considers the Site setting and context in terms of local and regional geology, hydrogeology, hydrology and historical land use. The information presented was obtained from an Envirocheck report (Reference: 243351977_1_1, and historical land use mapping (copies of which are presented in Appendix B).

3.1 Environmental setting

Table 3-1 below details the environmental setting of the Site including geology, hydrology and hydrogeology.

Table 3-1 Environmental setting

Published geology	Made Ground	The published maps do not show the presence of Made Ground. However, the presence of Made Ground across the Site was confirmed during the previous investigation in 2014.
	Superficial	British Geological Survey (BGS) data indicates that there are no superficial deposits underlying the majority of the Site. However, River Terrace Deposits are recorded in the northeast corner of the Site. Alluvium was recorded in the previous investigation whilst the River Terrace Deposits were found to be largely absent.
	Bedrock	BGS data indicates that the solid geology beneath the Site comprises the Kimmeridge Clay Formation, which was confirmed during the previous investigation.
Published boreholes	There are no published boreholes with available data in the vicinity of the Site. BGS ref. ST83SW31 is a well located approximately 270m south of the Site. It records c.20m of Kimmeridge Clay Formation with groundwater at approximately 1.5m below ground level (m bgl).	
Hydrogeology	The underlying bedrock is classified by the Environment Agency (EA) as Unproductive Strata. The superficial deposits in the northeast area of the Site, which extend to the east, are classified by the EA as a Secondary (A) Aquifer. This indicates that permeable layers to the east of the Site may be capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. The Site is not located within a groundwater Source Protection Zone (SPZ).	

Hydrology	Two small surface water features are shown in aerial photographs approximately 10m to the southeast of the Site. During the Site walkover, these ponds were identified but not accessible due to overgrown vegetation and a wire fence surrounding them. The River Shreen (Shreen Water) is located 320m to the northwest of the Site.	
Ground stability hazards	Collapsible ground	Very low
	Compressible ground	No hazard
	Ground dissolution	No hazard
	Landslide ground	Very low
	Running sand	No hazard to the northwest and very low hazard to the east.
	Shrinking or swelling clay	Low
Radon	The property is in a Lower probability radon area (less than 1% of homes are estimated to be at or above the Action Level). No radon protective measures are necessary for the construction of new dwellings or extensions.	
Flooding	The Site is classified by the EA as being in Flood Zone 1, i.e. land having a less than 1 in 1,000 annual probability of flooding by river or the sea (low risk).	
Environmentally sensitive sites	The Site is not located within or close to any environmentally sensitive (designated) sites.	

3.2 Regulatory database

Table 3-2 details the environmental information reviewed within the Envirocheck data report (see Appendix B).

Table 3-2 Regulatory database

Environmental Data	On-Site	Within 250 m	Within 500 m	Details
Discharge consents	0	1	18	The closest record to Site is located 147m northwest, granted to Wessex Water Services Ltd for a storm sewage overflow from the sewage

Environmental Data	On-Site	Within 250 m	Within 500 m	Details
				treatment works to be discharged at Shreen Water, however the authorisation was revoked in 2003. The other local discharge consents are also granted to Wessex Water Services Ltd, most of which are currently active for sewage discharges / final/treated effluent / storm sewage overflow to the river Shreen Water.
Local authority pollution prevention and controls	0	2	0	2no. active records are noted relating to the Hill Brush Company, for the manufacture of timber and wood-based products. They are located 143m and 147m north from the Site and relate to the factory formerly located adjacent to the north which is currently being redeveloped for a residential use.
Water abstractions	0	0	6	The closest water abstraction records are all granted to Mr S Burroughs, for the production of hydroelectric power. They are located 315m to 319m north of the Site and refer to water abstracted from Shreen Water at Lordsmead Mill.
Potentially infilled land (water)	2	0	4	2no. on-Site records dating from 1962 present unknown filled ground (pond, marsh, river, stream, dock etc) in the southeastern and northern areas of the Site. The rest of the off-Site records are also associated to unknown filled ground (pond, marsh, river, stream, dock etc), located 270m southwest, 321m south, 334m north and 495m southwest of the Site.
Contemporary Trade Directory Entries	2	3	2	Two on-Site inactive entries record former uses as plastic product manufacturing and general engineering activities (tooling). The closest (inactive) records off-Site include concrete reinforcement manufacture immediately west (assumed to be related to on-Site activity), marine engineers 66m southwest and brush manufactures 149m north of the Site.

Environmental Data	On-Site	Within 250 m	Within 500 m	Details
				Active entries off-Site are located 309m north for firework manufacturing, and 325m north for boiler servicing.
Points of Interest - Manufacturing and Production	3	2	0	On-Site records relate to a tank located in the southwest and works (industrial features) in the west. The closest off-Site records are for a factory situated approximately 80m north of the Site.
Points of Interest - Public Infrastructure	0	0	5	The closest records of public infrastructure to the Site are sluices (located 308m north, 314m north and 498m southwest of the Site) and a sewage works (located 331m-445m west of the Site).

3.3 Summary of historical land use

Table 3-3 details the relevant on-Site and off-Site historical features as identified in the historical land use mapping provided by Envirocheck (see Appendix B), supplemented by aerial imagery from Google Earth.

Table 3-3 Historical land use

OS Mapping	On Site land usage	Off Site land usage
1887 – 1888, 1901 & 1925 1:2,500 1890 1:10,560 1926 – 1927 1:10,560	The Site is a rectangular undeveloped area of land, bisected into two plots by a hedgerow. An unlabelled feature is shown near the southeast corner is assumed to be a small pond.	The surrounding land is predominantly undeveloped with plots of agricultural land to the west beyond Clement's Lane (Woodlands Road from 1901), which runs north to south along the western Site boundary. Occasional buildings, assumed to be associated with farmland, are located approximately 100m to the northeast of the Site. A sewage works (Mere R.D. Council) is located approximately 330m to the west of the Site and a disused silk factory is located 300m north of the Site.

OS Mapping	On Site land usage	Off Site land usage
1936 – 1942 1:2,500 1947 Aerial photography 1962 1:10,000	A small, unlabelled feature appears adjacent to the north boundary, near the northwest corner of the Site.	The closest surrounding land remains undeveloped. A brush factory is located 100m to the north. Sluices are located 200m to the east. An isolated tanks is recorded approximately 220m northwest of the Site. Residential dwellings are located 100m to the northeast of the Site.
1979-1980 1:2,500 1984 1:10,000	The Site is developed as an industrial works, which includes an electrical substation adjacent to the northern boundary and a tank near the Site centre. Originally the main structure was built in the west of the Site, with a second structure added near the centre before 1984. Travelling cranes are situated near the north and south borders of the Site. A chimney is adjacent to the main building, next to the western boundary. A small rectangular building is also located adjacent to the northern border of the Site.	An electrical substation and a chimney are located within the factory complex extending from 80m north of the Site. Another electrical substation is located within a residential setting, approximately 200m northeast of the Site. A pipeline is shown c.350m to the northwest of the Site.
1986 & 1995 1:2,500 2001 Aerial photography 2000 1:10,000	No significant changes recorded on Site.	The factory complex to the north has extended to bound the Site to the north and east.
2018 Aerial photography 2020	No significant changes recorded on Site.	The factory complex to the north and east of the Site has been demolished

OS Mapping	On Site land usage	Off Site land usage
1:10,000		and redevelopment as housing has commenced to the north.

4 Preliminary conceptual site model and risk assessment

Based on the findings of the desk study, potential sources of contamination have been identified at the Site as outlined in Section 4.1.

To this end, a conceptual site model (CSM) and preliminary risk assessment have been prepared in accordance with CLR11 (Defra and Environment Agency, 2004). The preliminary risk assessment provides a qualitative assessment of the risks that may occur to identified receptors as a result of the proposed development at the Site, comprising a residential led end use.

4.1 Preliminary conceptual site model

The sources of potential contamination, possible migration pathways and relevant receptors that have been identified in relation to the Site are detailed below. The CSM reflects the historical and current land uses at the Site and the understanding that the proposed change of use is from commercial/ industrial to residential with private gardens.

4.1.1 Sources

The potential on-Site and off-Site sources of ground contamination are summarised below.

On-Site sources

- Potentially elevated concentrations of inorganic and organic contaminants including non-aqueous phase liquids within subsurface soils and groundwater as a result of the historical manufacturing and related activity on Site, including:
 - large mechanically operated cranes;
 - bunded over ground tank(s);
 - redundant chimney currently adjacent to the western building together with associated fuel source and boiler; and,
 - Other potential sources from the previous use for chimney and plastic manufacture.
- Potentially elevated concentrations of inorganic and organic contaminants (including PCBs, solvents, lubricants, heavy metals) including non-aqueous phase liquids within subsurface soils and groundwater as a result of existing commercial / industrial operations on Site, including:
 - electrical substation;
 - ongoing welding/ metal works including potential for solvent based degreasing; and,
 - burning of waste on Site.
- Potential organic contaminants related to leaks from cars parked on-Site, scrap vehicles and a wide variety of domestic and electronic waste accumulated across the Site, including barrels with unidentified contents, chemical containers and gas canisters.
- Potential presence of asbestos containing materials (ACM) within surface and subsurface soils associated with the existing buildings.
- Potentially elevated concentrations of ground gases and/or vapours associated with made ground (including infilled land) and subsurface contamination.

Off-Site sources

- Potential for dissolved and non-aqueous phase contaminants associated with off-Site sources, including the Hill Brush Company and subsequent factory complex located immediately to the north and east of the Site. However, this is considered unlikely as the site is currently undergoing residential redevelopment.

4.1.2 Pathways

The key viable pathways (in the context of the proposed development) are outlined as follows:

- Direct dermal contact and ingestion of soil; ingestion of, or inhalation of dust;
- Inhalation of ground gases and/or vapours;
- Ingress of organic contaminants into potable water supply pipes and subsequent water ingestion;
- Uptake of contaminants by produce grown in the kitchen garden, and subsequent ingestion;
- Leaching of dissolved contaminants and horizontal or vertical migration through the unsaturated zone and/or preferential pathways to groundwater;
- Migration of gaseous phase contaminants through permeable soils and/ or along preferential pathways (water supply pipes, services, drainage runs etc.) and subsequent ingress to structures; and,
- Migration of free phase or dissolved contaminants horizontally into local surface water features (specifically the pond adjacent to the eastern boundary).

4.1.3 Receptors

The following receptors have been identified:

Human Health

- Future residents and visitors of the proposed development;
- Construction workers involved with the proposed redevelopment of the Site.

Wider Environment

- Groundwater within the River Terrace Deposits (Secondary (A) Aquifer) – where present;
- Local surface water features.

Other

- Future buildings.

4.2 Preliminary risk assessment

The potential contaminant sources, pathways and receptors (i.e. potential contaminant linkages) identified above are presented in a preliminary risk assessment in Table 4-1 and Table 4-2 below.

The qualitative assessment of the potential risks presented to identified receptors in relation to the proposed development has been made in accordance with the methodology outlined in CIRIA C552 (2001). As such, risk is considered to be a function of both the probability (likelihood) of contamination occurring at the Site and also the potential severity (consequence) of the environmental impacts associated with any such contamination. The risk classification methodology used to define contaminant probability, consequence and risk are described in Appendix C.

Table 4-1 Potential pollutant linkages (on-Site sources)

Source	Pathway	Receptor	Consequence of risk occurring	Probability of risk occurring	Preliminary Risk classification	Rationale/ potential risk management requirements
Potentially elevated concentrations of inorganic and organics contaminants within subsurface soils and groundwater associated with historical and existing industrial / commercial operations and the presence of a wide variety of waste deposited on Site.	Direct Contact (dermal, ingestion, dust inhalation)	Future Site users (residential)	Medium	Likely	Moderate	The previous Site investigation report (ESI, 2014) identified localised elevated concentrations of organic and inorganic contaminants within the Made Ground.
	Inhalation of vapours (indoors and outdoors) Ingress into potable water supply pipes Uptake by homegrown products and subsequent ingestion	Construction Workers	Medium	Likely	Moderate	Considering the numerous potential sources of contamination observed on Site coupled with the inclusion of gardens and areas of soft landscaping within the proposed residential setting, it is recommended that further Site investigation is undertaken to inform the existing land quality status. This should include suitable coverage post demolition of the existing buildings. Risks to construction workers may be mitigated through the provision of appropriate Personal Protective Equipment (PPE) and by adopting safe methods of working.

Source	Pathway	Receptor	Consequence of risk occurring	Probability of risk occurring	Preliminary Risk classification	Rationale/ potential risk management requirements
	Leaching of dissolved contaminants and subsequent vertical migration through permeable subsurface materials	Groundwater within underlying aquifer	Medium	Low likelihood	Moderate/ low	The moderate/ low risk to groundwater reflects the current and historical activities undertaken at the Site, the classification and discontinuous nature of the superficial geology and the classification of the bedrock.
		Surface water within the adjacent ponds	Mild	Low likelihood	Low	Risk of migration of contaminants from Site to surface waters is considered to be low based on the underlying geology, limited contamination identified in 2014 and the likely amenity value of the ponds.
Potential presence of ACM within soils from pre-2000 buildings on-Site.	Direct contact (dermal, ingestion and dust inhalation)	Future Site users (residential)	Medium	Likely	Moderate	ACM has been observed as part of the existing buildings, therefore the presence of asbestos fibres in the near-surface soils cannot be discounted
		Construction workers	Medium	Likely	Moderate	The requirement for remedial and/or risk management measures with respect to asbestos would be better understood following a suitable intrusive investigation.

Source	Pathway	Receptor	Consequence of risk occurring	Probability of risk occurring	Preliminary Risk classification	Rationale/ potential risk management requirements
						Risks to construction workers may be mitigated through the provision of appropriate Personal Protective Equipment (PPE) and by adopting safe methods of working.
Potentially elevated concentrations of ground gases and vapours within subsurface soils and groundwater associated with Made Ground on-Site.	Lateral and vertical migration of ground gas and/or vapours and potential asphyxiation and/or explosion	Future Site users (residential)	Medium	Likely	Moderate	Made Ground at the Site has the potential to generate ground gas and vapours and the previous investigation concluded the Site was likely to be CS3.
		Proposed buildings and structures	Medium	Likely	Moderate	It is recommended that further contemporary monitoring for the presence of ground gas/ vapours is undertaken as part of a Site investigation to understand the ground conditions.
		Construction workers	Medium	Low likelihood	Moderate/ low	Risks to construction workers may be mitigated through the provision of appropriate Personal Protective Equipment (PPE) and by adopting safe methods of working.

Table 4-2 Potential contaminant linkages (off-site sources)

Source	Pathway	Receptor	Consequence of risk occurring	Probability of risk occurring	Risk classification	Rationale/Potential risk management requirements
Potential ground gases/vapours and dissolved and non-aqueous phase contaminants associated with historical adjacent industrial land uses (i.e. Brush Hill Company) to the immediate north and northeast boundaries.	Migration of aqueous and non-aqueous phase contaminants leading to direct contact (dermal & ingestion)	Future Site users (residential)	Minor	Low likelihood	Low	The Hill Brush factory (and subsequent factory complex) adjacent of the Site presented a potential source of contamination; however, as that site has been redeveloped for a residential end use, any residual sources are likely to have been removed/ satisfactorily remediated.
		Construction workers	Minor	Low likelihood	Low	
	Migration of ground gases and vapours through unsaturated permeable subsurface materials	Proposed buildings and structures	Minor	Low likelihood	Low	
		Future Site users (residential)	Minor	Low likelihood	Low	
		Construction workers	Minor	Low likelihood	Low	

5 Conclusions and recommendations

5.1 Conclusions

The Site is located within a mixed residential and agricultural setting and is currently used by an online furniture store, with associated offices, as well as for unrelated welding and metal works along the northern boundary. Some employees of FurnitureBox UK are currently living in caravans in the south of the Site. The central and western parts of the Site are hardsurfaced, where the main warehouses and offices are located, while the eastern boundary area comprises soft-standing covered in vegetation.

The Site has historically been used for the manufacture of steel chimneys since the 1970s. Evidence of this remains on-Site, including an over ground tank, a redundant chimney, ground level rail-tracks associated with former mechanical cranes, and an operational electrical substation and transformer. Additionally, during a Site walkover undertaken on 2nd June 2020, numerous potential sources of contamination were identified relating to a wide variety of domestic and electronic waste that was observed scattered across the Site, including various containers of undetermined contents and scrap vehicles.

The bedrock geology on Site comprises the Kimmeridge Clay Formation overlain by superficial River Terrace Deposits in the northeast of the Site and Made Ground associated with historical land use across the whole Site. Alluvium was also identified during the previous site investigation works. The underlying bedrock is classified as Unproductive Strata, whilst the superficial River Terrace Deposits located in the northeast of the Site are classified as a Secondary (A) Aquifer.

Due to the historical and ongoing potential sources of contamination at the Site, it is considered to present a moderate risk to human health receptors in a residential end use scenario. A moderate/low risk is also considered to be present to groundwater.

5.2 Recommendations

The preliminary risk assessment for a proposed residential land use has generally resulted in a moderate/low to moderate risk rating for the pollutant linkages identified for on-Site sources of potential contamination.

Through a suitable condition of planning, in order to refine the preliminary risk assessment herein and thereby ascertain the existing land quality status of the Site, it is recommended that a proportionate level of intrusive investigation is undertaken to support the proposed development. The findings of the intrusive investigation would be used to assess the requirement for suitable risk management and/or remedial measures to be incorporated as part of the redevelopment works.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Wiltshire

Published 1887 - 1888

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Map Name(s) and Date(s)

063_05 1887 1:2,500	063_06 1887 1:2,500

Published 1986

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1995

Source map scale - 1:2,500

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Historical Aerial Photography

Published 1947

Source map scale - 1:10,560

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

10k Raster Mapping

Published 2000

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2020

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

Risk classification methodology

The method of risk evaluation adopted in this document is consistent with CIRIA C552 (2001). Hence, risk is considered to be a function of both the probability (likelihood) of contamination occurring at the study site and also the potential severity (consequence) of the environmental impacts associated with this contamination.

The classification system used to define contaminant probability, consequence and risk is described in the following tables.

Table A: Classification of probability

Classification	Definition
High Likelihood	There is a contaminant linkage and an event that appears either very likely in the short term and almost inevitable over the long term, or there is evidence at the receptor of harm or pollution.
Likely	There is a contaminant linkage and all the elements are present and in the right place, which means that it is probably that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term, and likely over the long term.
Low Likelihood	There is a contaminant linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such event would take place, and is less likely in the shorter term.
Unlikely	There is contaminant linkage but circumstances are such that it is improbable that an event would occur even in the long term.

Table B: Classification of consequence

Classification	Receptor	Definition	Examples
Severe	Humans	Short-term (acute) risk to human health likely to result in "significant harm" as defined in the CTL Statutory Guidance	High concentrations of cyanide on the surface of an informal recreation area
	Controlled waters	Short-term risk of pollution (note: Water Resources Act contains no scope for considering significance of pollution) of sensitive water resource	Major spillage of contaminants from site into controlled water
	Property	Catastrophic damage to buildings/property	Explosion, causing building collapse (can also equate to an acute human health risk if buildings are occupied)
	Ecology	A short-term risk to a particular ecosystem, or organism forming part of such eco-system	Potentially long term derogation of a designated site or protected species
Medium	Humans	Chronic damage to human health ("significant harm" as defined in the CTL Statutory Guidance)	Concentrations of a contaminant from a residential site exceed the site-specific assessment criteria
	Controlled waters	Pollution of sensitive water resources (note: Water Resources Act contains no scope for considering significance of pollution)	Leaching of contaminants from a site to a principal or secondary aquifer
	Property	Significant damage to crops, buildings, structures and services	Damage to building rendering it unsafe to occupy (e.g. foundation damage resulting in instability).
	Ecology	A significant change in a particular ecosystem	Death of a species within a designated nature reserve

Classification	Receptor	Definition	Examples
Mild	Humans	Contamination present although unlikely to constitute a significant chronic health risk	Concentrations of a contaminant from a public access site moderately exceed the generic assessment criteria
	Controlled waters	Pollution of non-water resources	Pollution of non-classified groundwater
	Property	Damage to sensitive. buildings/structures/services	Aggressive ground conditions leading to potential for long term degradation of buried concrete
	Ecology	Damage to the environment	Localised damage to aquatic habitat causing temporary relocation of certain species
Minor	Humans	Non-permanent health effects to human health (easily prevented by means such as personal protective clothing etc.)	The presence of contaminants at such concentrations that protective equipment is required during site works.
	Controlled waters	Potential minor release of contamination to local water features	Short term or low volume release of potentially polluting material to a secondary surface water course of low existing quality
	Property	Easily reparable effects of damage to buildings, structures and services. Harm which may result in a financial loss, or expenditure to resolve.	The loss of plants in a landscaping scheme. Discolouration of concrete
	Ecology	Short term, localised damage may occur; consequences are spatially and temporally limited	Short term or localised disruption to in situ flora or fauna; no lasting effects

Table C: Risk classification (comparison of consequence and probability)

Probability (likelihood)		Consequence (severity)			
		<i>Severe</i>	<i>Medium</i>	<i>Mild</i>	<i>Minor</i>
	<i>High likelihood</i>	Very high risk	High risk	Moderate risk	Low risk
	<i>Likely</i>	High risk	Moderate risk	Moderate/low risk	Low risk
	<i>Low likelihood</i>	Moderate risk	Moderate/low risk	Low risk	Very low risk
	<i>Unlikely</i>	Moderate/low risk	Low risk	Very low risk	Very low risk
