Purpose of Document:

This document provides a visual reference for the main Landscape Visual Appraisal, and should be read in conjunction with this report.

LVA Photography Approach:

The use of photographs and photomontage imagery for landscape and visual impact assessment has developed with the changing specification of digital photography. The Landscape Institute have produced guidance for ‘Visual Representation of Development Proposals (LI TGN 06/19). This sets out recommendations for the application of photographic equipment and techniques for different purposes and visualisation types.

A landscape appraisal for a non-EIA development falls into ‘Category B’ of this guidance which suggests that appropriate visualisation types 1-4 may be appropriate.

Type 1 visualisations are annotated viewpoint photographs as have been used in this instance. The guidance confirms that for Type 1 visualisations a digital crop frame camera with a fixed 35 mm lens is acceptable. Ideally these should be single frame images presented on an A3 sheet.

Single frame images are most useful for viewing the detail of a site area from respective viewpoints. But at the same time, they do not convey the full extent of a panoramic view that a viewer may experience from many viewpoints. Within this collection of images both single frame and stitched panoramic views are provided to allow both aspects to be judged.

The camera used is a cropped frame Nikon d3200. Stitched together panoramic views are subject to some distortion in the image but are still useful for the simple purpose of illustrating the overall view available in any particular location (where used they are labelled as such). On occasional middle distance views a single frame is not sufficient to capture the extent of the site in view. For these a stitched image may be used to help illustrate the general view.

With all photographic imagery for assessments these are ideally used only as an aid-memoir to support site visits and assessment.
