Dear David

It was very useful to meet with you and Councillor [REDACTED] on Wednesday.

As promised I have attached the technical data sheet for the light fittings installed within the barn. The sheet confirms the downlighting design of the beam angle, (90 degrees, so 45 degrees either side of the downward vertical line).

There is therefore no lighting installed or proposed that would create upward light emittance. Also, we can again clarify that out of normal hours working is very rare.....emergencies only. Also, that bat activity in the winter months is minimal, so wouldn't be affected by any modest 'glow'.

I hope this helps to clarify the situation.

Please let me know if you have any questions.

Kind regards

Howard
