DISCLAIMER:

The copyright of this document remains with ABR Ecology Ltd. The contents of this document therefore must not be copied or reproduced in whole or in part for any purpose without the written consent of ABR Ecology Ltd. This report remains the property of ABR Ecology Ltd until payment for the agreed services has been received in full.

ABR Ecology Ltd shall not be liable for the use of this report for purposes other than those for which the report was prepared and provided.

This report has been prepared to identify the presence of bats and nesting birds within the site, where this falls within the scope of the agreed works.

This report has been produced using all reasonable skill and care, and a Quality Assurance (QA) review process has been undertaken prior to issue of this report. If the reader identifies any inaccuracies or discrepancies, this should be brought to the attention of ABR Ecology immediately.

It is at the discretion of the Local Planning Authority (LPA) to determine whether the information and data on protected species contained within this report is made publicly available.

SURVEY DATA LIFESPAN AND VALIDITY:

Survey data is considered valid for 12-18 months from the survey date in accordance with the CIEEM Advice note (CIEEM, 2019), due to the presence of and/or potential for mobile species to be present within the site. The 12–18-month period is taken where the condition(s) of the building(s)/structure(s) on site remain unchanged since the survey and the proposals for the site are unchanged. If any changes to the plans occur, this report may not be valid, and any conclusions provided may not be appropriate. In this event, it is the responsibility of the applicant to contact ABR Ecology to determine whether an amended report or resurvey of the site is required.

Update survey data will likely be required to inform a bat European Protected Species (EPS)/ Bat Mitigation Class Licence (BMCL) licence application. The building inspection (PRA) is considered valid for 3 months and activity data from the then current survey season (May – August/September) to inform a bat licence application.

This document has been prepared in accordance with CIEEM's Guidelines for Ecological Report Writing 2nd ed (CIEEM, 2017a) and the Bat Conservation Trust (BCT) Good Practice Guidelines 4th ed (Collins, 2023).

ABR Ecology Ltd cannot accept responsibility for third party data supplied within this report.

At the time of writing, standard methodologies have been used which are accepted by Natural England and other statutory bodies. No responsibility will be accepted where standard methodologies change and where Government, national bodies and industry subsequently modify standards.

The results of the surveys and this assessment are representative at the time of the surveys taking place.

NON-TECHNICAL SUMMARY

- ◆ ABR Ecology Ltd were commissioned by Linda Lynch to undertake one bat activity (dusk) surveys at 8 Mount Pleasant, Chippenham, Wiltshire, SN14 6LQ to advise on the presence/absence of bats and nesting birds at the property.
- ◆ This report was requested to support a planning application for a two-storey extension the western elevation.
- ◆ The PRA and nesting birds survey was undertaken on the 9th March 2026 which identified the building to hold 'high' potential for roosting bats. The results of the PRA can be found within the report titled 'Preliminary Roost Assessment (PRA) report – 8 mount Pleasant (Johns Associates, 2026).'
- ◆ Three bat activity surveys were conducted on the 8th June, 29th June and 20th July 2026.
- ◆ No bats were recorded emerging/re-entering the building during the surveys following the BCT Good Practice Survey Guidelines and therefore the building is considered unlikely to support a bat roost at this present time.
- ◆ While no bat roost(s) were identified within the building, the general site supports commuting and foraging bats, and there is potential for artificial lighting to impede bats using the general property. Therefore, specifications for artificial lighting are provided in Section 4 of this report.
- ◆ Survey data is valid for 12–18 months from the survey date, provided the site conditions and proposals remain unchanged. If plans change, or if this period passes before works begin, the report and its conclusions may no longer be valid; the applicant should contact ABR Ecology to confirm whether an amended report or resurvey is required.
- ◆ The presence of a bat roost is considered unlikely; however, it is not possible to have complete certainty that a bat roost is not present; therefore, further information is provided in Section 4 on what to do in the unlikely event that a bat is discovered during the works.
- ◆ Two swift bricks will be provided as an enhancement to ensure the application is compliant with planning policy. This is detailed in Section 4.

1. INTRODUCTION

- 1.1 ABR Ecology Ltd were commissioned by Linda Lynch to undertake three bat activity (dusk) surveys at 8 Mount Pleasant, Chippenham, Wiltshire, SN14 6LQ (central grid reference: ST 90229 74439) to advise on the presence/absence of bats and nesting birds at the property. This report was requested to support a planning application for a two-storey extension the western elevation.
- 1.2 The PRA and nesting birds survey was undertaken on the 9th March 2026 (see accompanying report – Johns Associates, 2026). The bat activity (dusk) surveys were conducted on 8th June, 29th June and 20th July 2026.
- 1.3 Existing elevations are provided in Appendix A and proposed elevations are provided in Appendix B.

Aims and scope of the surveys and report

- 1.4 The results of the activity (dusk) surveys and the data search were principally aimed at determining if a bat roost is present within the property and/or whether the building(s)/structure(s) hold the ‘potential’ to support roosting bats in line with The BCT Good Practice Guidelines 4th ed (Collins, 2023). The results of the data search were also used to determine the Zone of Influence (Zol) for bats associated with the project.
- 1.5 The survey(s) and report aim to establish whether the proposed works will likely impact roosting bats following the roost characterisation surveys; the report also aims to identify if there is a requirement for a bat European Protected Species (EPS) licence from Natural England to allow the works to proceed lawfully following planning approval.
- 1.6 The aim of the nesting birds survey was to determine if there is any recent or historical evidence of nesting birds within the building on-site.

Relevant planning policy and legislation

- 1.7 Full details of relevant planning policy and legislation are provided within the accompanying PRA report (where ABR Ecology provided this); the following policy and legislation in respect of bats and nesting birds is applicable to this application:

- ◆ The Conservation of Habitats and Species (Amendment) (EU Exit) Regulations 2019

- ◆ The Wildlife and Countryside Act 1981 (as amended) – Section 1 and Schedule 1 (birds) and 5 (bats)
- ◆ The Natural Environment and Rural Communities (NERC) Act 2006 – Sections 40 and 41
- ◆ The Environment Act 2021
- ◆ The National Planning Policy Framework (NPPF) 2024 – Section 15
- ◆ National Planning Practice Guidance Natural Environment (para 10-35)
- ◆ Circular 06/05: Biodiversity and Geological Conservation – Statutory Obligations and Their Impact Within the Planning System
- ◆ The Wiltshire Council – adopted 2015

1.8 It is the responsibility of the applicant(s) to ensure that the proposed development proceeds in full compliance with legislation, national and local policy, and in accordance with all conditions of the obtained planning consent(s). It is also the responsibility of the applicant(s) to request a report amendment / reassessment of the site for roosting bats and nesting birds where the scale/nature of the proposed plans subsequently change.

2. METHODOLOGY

Bat activity (dusk) survey(s)

- 2.1 The dusk survey(s) were conducted in accordance with the BCT Good Practice Guidelines (4th Ed) (Collins, 2023) and the Interim Guidance Note: Use of Night Vision Aids for bat emergence surveys and further comment on dawn surveys (BCT, 2022).
- 2.2 The survey(s) involved a direct observation of the external building to identify any bats emerging from their roosts. The ecologists used automated bat detectors and a Night Vision Aid (NVA) to identify any later emerging species and to identify bats where vision was limited (for example, roofs under the cover of tree canopies).
- 2.3 Where present, information was compiled on the species, numbers, access points, roosting locations and flight paths. Information was also obtained on general activity on site such as foraging and commuting bats crossing the property.
- 2.4 The dusk survey(s) commenced 15 minutes before sunset and finished between 1.5-2hrs after sunset. The survey was conducted when the temperature was $\geq 10^{\circ}\text{C}$ with no strong winds or precipitation.
- 2.5 Following the dusk survey(s), the footage from the NVAs was reviewed by an analyst using a motion detection software. Bat calls were analysed using Kaleidoscope Pro Analysis Software.

Personnel competencies

- 2.6 The dusk survey(s) were conducted by competent surveyors; each ecologist/surveyor was assessed against the Chartered Institute of Ecology and Environmental Management (CIEEM's) and BCT competency frameworks, as shown in Table 1 below:

Table 1: CIEEM and BCT competency frameworks and level of experience/skills

BCT level	Equivalent CIEEM competency levels	Description
1	Basic	Some knowledge, experience and skills but always works under supervision.
2	Capable	Has knowledge, experience and skills to carry out surveys independently (except for swarming and ALBST), lead and design simple surveys and mitigation and deal with simple planning/mitigation licensing. Assumes a survey licence from the relevant licensing authority for the relevant activities.

3	Accomplished	Has knowledge, experience and skills to carry out and lead complex surveys, design surveys and mitigation and deal with planning/mitigation licensing.
4	Authoritative	Has knowledge, experience and skills to lead the most complex projects such as those involving EIA or HRA.
5	Specialist	Has knowledge, experience and skills in specialist bat survey techniques. Assumes Levels 3 and/or 4 NE licence – mist netting, acoustic lure, harp trapping or equivalent.

2.7 Ecologist/surveyor competencies are provided in Table 2 below:

Table 2: Personnel competencies

Ecologist/surveyor	Bat licence	Ecologist level	Number of years undertaking bat activity surveys	CIEEM competency
Peter Allen	Class 1	Assistant ecologist	4	Accomplished
Emily Parsons	-	Assistant ecologist	4	Accomplished
Keeley Lanigan	-	Assistant ecologist	2	Capable
Sophie Burry	-	Graduate ecologist	1	Basic
Abi Parsons	-	Seasonal surveyor	2	Basic

Nesting birds

2.8 During the survey(s), evidence of potential nesting activity was noted; evidence can include the physical presence of chicks and/or adult birds, often returning and leaving a nesting site, nesting material, eggs and/or egg casings, feathers, white splashing (droppings), and pellets (for barn owls).

Survey limitations

2.9 ABR Ecology Ltd accepts no liability for the accuracy, completeness or conclusions of Preliminary Roost Assessment (PRA) reports prepared by third parties.

Bat activity (dusk) survey(s)

2.10 Some bat species, particularly long-eared (*Plecotus sp.*) and *Myotis* spp. bats, emerge later in the evening when light levels are low, making it difficult to identify bats which have emerged from the building. To overcome this constraint, the survey was supplemented by Night Vision Aids (NVAs) which can identify bats emerging from their roost(s) during darkness.

2.11 Environmental conditions can affect bat activity, including temperature, humidity, wind speed and precipitation. The effect of weather conditions on active bats is likely to be

different for different species in different situations (e.g. open versus sheltered habitats), for example, pipistrelle (*Pipistrellus sp.*) bats are more resilient to changes in ambient temperature.

- 2.12 Bats of the *Myotis* genus possess very similar calls, and it can be difficult to distinguish different species. The identification of *myotis* bats relies on the analyst's interpretation.

Reporting and survey data lifespan

- 2.13 This report is considered valid for 12-18 months from the survey date in accordance with the CIEEM Advice note (CIEEM, 2019) for planning purposes only; and is only intended for the proposed plans outlined within this report. If any material changes to the building/site occur or if the nature and/or extent of the proposed development changes, an update visit to reassess the building will be required, as any conclusions provided herein may not be valid.

3. RESULTS

Bat activity (dusk) survey(s)

- 3.1 A summary of the survey results is provided in Table 4 below (full results are provided in Appendix C and the locations of bat roosts/bat exit/entry points with surveyor locations is provided in Appendix D):

Table 4: Summary of results from the dusk survey(s)

Date of survey	Bats recorded emerging from/re-entering the building	Bats generally recorded commuting and foraging across the site
08/06/2026	No bats were recorded or re-entering during the survey.	- Common pipistrelle (<i>Pipistrellus pipistrellus</i>)
29/06/2026	No bats were recorded or re-entering during the survey.	- Common pipistrelle - Noctule (<i>Nyctalus noctula</i>)
20/07/2026	No bats were recorded or re-entering during the survey.	- Common pipistrelle - Soprano pipistrelle (<i>Pipistrellus pygmaeus</i>) - Noctule

- 3.2 Following the completion of the survey(s), the building is not considered to support a bat roost at this present time. Therefore, impacts on roosting bats are considered unlikely. Further information regarding what to do in the unexpected event that a bat is found during the works and survey data lifespan is provided in Section 4 of this report.

Indirect impacts upon bats - lighting

- 3.3 The development is also anticipated to result in a change to Artificial Lighting At Night (ALAN) through internal light spill and external light fixtures.
- 3.4 A number of commuting and foraging bats were recorded across the general property and within the gardens. Bats are very sensitive to artificial lighting, which can impede their ability to successfully forage and can alter flightpaths (BCT & ILP, 2023). As bats are using the property during nocturnal hours, it is also essential that new lighting is designed to minimise impacts on foraging bats, particularly around areas with mature vegetation such as trees and hedges. Light spill can extend beyond the site boundary and may therefore also impact bats using neighbouring land.
- 3.5 Specifications for new lighting designed to reduce impacts on bats are detailed in Section 4.

4. CONCLUSIONS, MITIGATION AND ENHANCEMENT PLAN

Conclusions on roosting bats

- 4.1 The surveys were undertaken and no bats were recorded roosting within the building. Therefore, roosting bats are not considered likely to be impacted by the proposed works as shown in Appendix B of this report.
- 4.2 The PRA and dusk surveys only provide a 'snapshot' in time and do not account for seasonal variation; bats may have been overlooked due to seasonal constraints. Bats are a highly mobile species and as such, it is not possible to have complete certainty that bats are not present, rather, that there was no indication of bats at the time of survey.
- 4.3 The surveys can only be considered valid for 12-18 months from the survey dates in accordance with the CIEEM Advice Note (CIEEM, 2019). The 12–18-month period is considered acceptable where the condition of the building/structure on site remain unchanged since the survey and the proposals for the site are unchanged. If any changes to the plans occur, or if 12-18 months pass and no works have been undertaken, this report and any conclusions provided will not be valid. In this event, it is the responsibility of the applicant to contact ABR Ecology to determine whether an amended report or resurvey of the site is required.
- 4.4 **In the unlikely event bat(s) are encountered at any stage, work must cease immediately and Natural England or a suitably qualified bat ecologist must be sought for advice by the applicant/landowner.** The applicant must be aware of the severe penalties associated with bat crimes and their legal obligation to report this information.
- 4.5 In the event a bat is unexpectedly discovered, the nature of the advice will concern allowing the bat(s) to leave of their own accord or waiting for a licensed person to remove the bat(s). A bat licence may then be deemed necessary following the necessary survey work. **All persons including contractors are explicitly forbidden from handling bats or interfering with bats in any way.**

Foraging and commuting bats

- 4.6 The site supports commuting and foraging bats. The following specifications for lighting must be adhered to and are based upon the 'Bats and Artificial Lighting At Night' Guidance Note BN08/23 (BCT & ILP, 2023):

- ◆ Preferably, no new external light fixtures will be installed. If external lighting is required, this will be installed where required for safety purposes only. No external luminaires will be installed where these will cast light spill onto surrounding vegetation, such as mature trees.
- ◆ All luminaires will lack UV elements when manufactured. Metal halide, compact fluorescent sources will not be used.
- ◆ LED luminaires only will be used due to their sharp cut-off, lower intensity, good colour rendition and dimming capability.
- ◆ A warm white light source (2700Kelvin or lower) will be adopted to reduce blue light component.
- ◆ Light sources will feature peak wavelengths higher than 550nm to avoid the component of light most disturbing to bats (Stone, 2012).
- ◆ Internal luminaires will be recessed only (as opposed to using a pendant fitting) where installed in proximity to windows to reduce glare and light spill.
- ◆ Column heights must be carefully considered to minimise light spill and glare visibility. This must be balanced with the potential for increased numbers of columns and upward light reflectance.
- ◆ Only luminaires with a negligible or zero Upward Light Ratio, and with good optical control, will be used.
- ◆ Luminaires must always be mounted horizontally, with no light output above 90° and/or no upward tilt.
- ◆ External security lighting will be set on motion sensors and set to a 1 minute (or less) timers.
- ◆ Bollard or low-level downward-directional luminaires will not be installed. This is due to a considerable range of issues, such as unacceptable glare, poor illumination efficiency, unacceptable upward light output, and increased upward light scatter from surfaces.
- ◆ Only if all other options have been explored, accessories such as baffles, hoods or louvres can be used to reduce light spill and direct it only to where it is needed. However, due to the lensing and fine cut-off control of the beam

inherent in modern LED luminaires, the effect of cowls and baffles is often far less than anticipated and must not be relied upon solely.

Biodiversity enhancements

- 4.7 The following enhancement will be included as part of the development (see Appendix E for location and design):
- ◆ Two 'PRO UK Visible Build-In Swift Box' will be installed within the masonry of the new north-facing elevation at eaves level.
